On the polysemy of agentive suffixes in English and Croatian:

comparing –er and –ač

Završni rad

Mentor: izv.prof.dr.sc. Gabrijela Buljan

Osijek, 2015.

Summary and key-words

This paper deals with the semantic roles of nouns that end in -er in English and in $-a\check{c}$ in Croatian. Both suffixes are productive in their respective languages. The goal of the research was to see which semantic roles can be taken by words formed with each of these suffixes. With the help of a theoretical overview and a research conducted in the corpora of English and Croatian, it was discovered that the suffix -er is much more polysemous than the suffix $-a\check{c}$, since it is productive in the formation of the majority of semantic roles in varying degrees. The suffix $-a\check{c}$ is only productive in the formation of agent and instrument nouns. The suffix -er also attaches to a greater variety of bases than the suffix $-a\check{c}$. What can also be seen from the results of the research is that single English words with the suffix -er can more commonly take different semantic roles in context than the Croatian ones with the suffix $-a\check{c}$.

Key words: -er, $-a\check{c}$, word formation, semantic role, polysemy, context, corpus research

1. Introduction

This paper will be dealing with the semantic roles of nouns in English and Croatian, namely those nouns formed with the addition of the suffixes -er in English and $-a\check{c}$ in Croatian. These suffixes are both very productive in the word formation of nouns in their respective languages, and the goal of this research is to see what specific semantic roles the words formed with these suffixes can take in context. The assumption is that the two suffixes correspond in the semantic roles of agent and instrument, but that -er is more versatile than $-a\check{c}$ and that it often takes other semantic roles, as well. In order to prove this hypothesis, research will be conducted using the corpora of English and Croatian in order to observe the words formed with these suffixes in context and to see in what semantic roles they can be found in actual usage.

As for how the paper will be structured, first, a theoretical framework will be given for the concept of semantic roles in general, then for the suffix -er as described in grammar books and relevant linguistic research conducted so far, and in the next segment, the same will be given for the suffix $-a\check{c}$. Then, an overview of the methodology of the research will be given. In the next chapter, the examples gathered from the corpora of English and Croatian will be given, and the selected words will be analyzed in terms of semantic roles. Also, information will be provided regarding their usage in context. The results will be presented in the form of two tables. The first table will contain the English words formed with the suffix -er. The second table, presented in section 4.2., will include the Croatian words formed with the suffix $-a\check{c}$. What will follow is a discussion of our findings, and finally, based on the theoretical framework and the results of the conducted research, a conclusion will be given as to the semantic roles that the words formed with the suffixes -er and $-a\check{c}$ can take, and the suffixes themselves will be compared to each other.

2. Theoretical Framework

2.1. Defining semantic roles

Since the concept of semantic roles¹ was first introduced in the 1960s in the works of Gruber and Fillmore, it has become crucial for linguistic analysis (Luraghi and Narrog 2014: 1). There is, however, no general consensus as to the classification of semantic roles. Different linguists that have dealt with them since the 1960s have developed their own categories and divided the roles words take in sentences in different ways.² Given space limitations, these different approaches to the concept are not going to be discussed at length. Instead, the categories used by various linguists will be combined into a single group that will be used here when describing the semantic roles of words in English with the suffix -er and those in Croatian with the suffix $-a\check{c}$. Special regard will be paid to Cruse's (2000, 2006), as well as Huddleston and Pullum's (2002) approach.

According to Huddleston and Pullum, the first semantic role that appears to be useful for linguistic analysis, and our analysis especially, is the CAUSER. This role can be defined as a role that "involves immediate or direct causation of an action or event" (2002: 230). A subtype of the causer role would be the AGENT, which is prototypically "animate, supplies the energy for the action, and acts deliberately" (Cruse 2000: 283). Some linguists distinguish the FORCE and the EFFECTOR from the agent, and the former is usually defined as "an inanimate doer" (Cruse 2006: 68), whereas the latter is defined as an "agent-like entity [that] supplies the energy, but not the will" (Cruse 2000: 283).

The second major semantic role would be that of the INSTRUMENT. It can be defined as "an entity prototypically used by an agent in performing an action" (Huddleston and Pullum 2002: 231), and is mostly described as "something inanimate" (Cruse 2006: 68).

The next important semantic role is the EXPERIENCER, "an animate participant in an event affected in a characteristically animate way" (ibid.). There is also the BENEFICIARY, which is defined as "an animate participant for whose sake an action is performed" (ibid.). Since these two semantic roles are quite similar, they "are sometimes included under dative" (ibid.).

¹ Semantic roles are also called functional roles, participant roles, case roles, deep cases, and thematic roles (Cruse 2006: 68).

² Cf. Cruse 2000: 281-4, Cruse 2006: 68-9, Huddleston and Pullum 2002: 230-3.

LOCATION is defined as "the place most relevant to an event" (Cruse 2006: 68), and its subtypes include static location, source, path and goal (Huddleston and Pullum 2002: 233).

The final semantic role that is important to mention is the PATIENT, which is an entity "affected by an action performed by some causer, especially an agent" (ibid. 231). Judging from this definition, it is noticeable that the role of the patient is quite similar to the role of the experiencer. In defining the experiencer, Cruse explicitly states that this semantic role is distinguishable by the fact that it denotes a participant "affected in a characteristically animate way" (2006: 68). The difference between the patient and the experiencer thus depends on our interpretation of what "a characteristically animate way" means. Huddleston and Pullum, however, make the distinction between the experiencer and the patient a bit clearer by stating that the role of the experiencer "prototypically appear[s] in situations of emotional feeling or sensory perception" (2002: 231). This definition thus helps us distinguish the experiencer from the patient more easily, since the former is specifically recognized by appearing in such situations as those described.

These semantic roles are the result of the work of several linguists, and are mostly used solely in regard to English. However, although there are many linguistic works that deal with the definition and classification of semantic roles, it should be mentioned that these roles are not universally accepted among linguists. Apart from the fact that different linguists group and define the semantic roles in different ways, there are also some linguists who believe that these categories are not relevant and should not be dealt with at all, and some who believe that they are not universal, i.e. that they are characteristic only of some languages, and not of all of them (cf. Luschützky 2011: 75-97; Luschützky and Rainer 2011a: 3-7; Luschützky and Rainer 2011b: 287-338; Müller 2011: 33-40; Palmer 1976: 142-3; Rosenberg 2011: 53-64; Scherer 2011: 41-52).

Despite this point of view, we will treat semantic roles as language-independent categories, and the set of semantic roles that was provided in this chapter will be used in defining not only the English, but also the Croatian examples. This will provide the necessary basis for the comparison of the words formed with the suffixes -er in English and $-a\check{c}$ in Croatian.

This section gave a brief overview of semantic roles in general. In the next section, we present a brief overview of the treatments of the suffix -er in some of the sources cited above and of the treatment of $-a\check{c}$ in the relevant Croatian word formation literature.

2.2. Semantic roles and bases connected with the suffix -er

Judging from the semantic roles that the suffix -er has been linked with in theoretical linguistic works, this suffix appears to be quite polysemous. Huddleston and Pullum state that "[n]ouns in -er exhibit a wide range of meanings" (2002: 1698). In this segment, a reasonably detailed description will be given of all the roles that have been attributed to -er suffixations in Panther and Thornburg (2003), Huddleston and Pullum (2002), Bauer (1983) and Adams (1973).

The first major role that should be mentioned is that of the causer. In Panther and Thornburg (2003), this role has been divided into five further subcategories. The first subcategory would be the one that has the prototypical sense of the agent, which was defined in the previous chapter and is also "the central sense of -er" (Panther and Thornburg 2003: 285). It encompasses three different senses; that of "a highly agentive human being who pursues some professional activity or performs some action with a more or less strong impact on a Patient" (ibid. 286), that of a human being that "avocationally or habitually or characteristically engage[s] in activities ... that do not involve a Patient" (ibid.), and that of "human Agents with regard to occupational activities - though their respective bases do not name the action the Agent performs" (ibid. 287). Examples of these three senses of the first category would be teacher, runner, and hatter³, respectively. The other four categories can all be described as agent-like formations, and as far as the meanings are concerned, animals (e.g. pointer, retriever), plants (e.g. Venus flycatcher, creeper), inanimate objects (e.g. skyscraper, gas-guzzler 'a car with relatively low fuel efficiency'4), and agent/causer events (e.g. thriller, groaner 'an event which makes the experiencer groan') can be distinguished. All the agentlike meanings can be understood as words "personified as human agents with characteristic traits" (ibid. 292). When it comes to Huddleston and Pullum, they state that the agentive meaning is the central one when it comes to -er suffixations, and also mention the use of -er suffixations in "[l]exicalised animal names" (2002: 1698). They also talk about "other kinds of causer in reminder, eye-opener" (ibid.). In Adams (1973) and Bauer (1983), suffixations of this kind are not discussed at length, but mentioned in passing. However, Adams also names the -er suffix as one of agentive suffixes (1973: 30), and Bauer talks about the agentive meaning of -er suffixations as a subtype of subject nominalizations (1983: 285-6).

³ The division and terms for the semantic roles, as well as the examples and paraphrases used in this chapter are taken from (Panther and Thornburg 2003), except where otherwise stated.

⁴ The paraphrase is taken from http://www.thefreedictionary.com/.

The second semantic role, that of the instrument, has been divided into three subtypes in Panther and Thornburg (2003); the first subtype would involve the prototypical meaning of the instrument⁵, and examples of it would be *can opener* and *dishwasher*. The second subtype can be referred to as the quasi-instrument, which the authors define as "articles of clothing worn by an Agent in carrying out a particular action" (Panther and Thornburg 2003: 293). Some examples of this type of instrument would be *sneakers* and *loafers*. The third subtype of instrument would be instrument-like events, which can be defined as events that "are designed for particular purposes" (ibid. 301), and examples would be *fundraiser* and *mixer* 'event that has the function to mix males and females'. Huddleston and Pullum also mention the instrument as one of the semantic roles that *-er* suffixations can have (2002: 1698), and Adams names some examples of the instrumental use of *-er* words, e.g. *refresher course* 'John refreshes (his knowledge) by means of the course' (1973: 69). As with the agent, Bauer mentions the instrumental meaning of *-er* suffixations as being a subtype of subject nominalizations (1983: 286).

The third semantic role, that of the experiencer, is present in items like *admirer* and *loser* (Huddleston and Pullum 2002: 231) and has no further subdivisions. Interestingly, Panther and Thornburg do not list the experiencer as a separate semantic role, and neither does Adams. Bauer, however, does mention it, again as one of subject nominalizations (1983: 286).

Location, as the fourth semantic role to be discussed, is also not further divided, and includes examples such as *sleeper* and *diner*. This role is found in Panther and Thornburg under the name of purpose-location (2003: 294), whereas Huddleston and Pullum state that the given examples are "complement[s] of a preposition" (2002: 1698). This role is not mentioned in Adams (1973). Although Bauer mentions it as a semantic role (1983: 144), she does not link it to *-er* suffixations.

The fifth semantic role, the patient, is also quite relevant for the suffix –er. According to Panther and Thornburg (2003), it can be further divided into purpose-patient, valued-patient, true-patient, and patient event. Purpose-patients are those patients that "are designed for a special purpose" or that "have inherent properties that make them suitable for certain purposes" (Panther and Thornburg 2003: 295). Some examples would be *scratcher* 'lottery ticket' or *stocking-stuffer* 'small gift suitable for Christmas stocking'. Valued-patients "fulfill

⁵ "[A]n entity prototypically used by an agent in performing an action" (Huddleston and Pullum 2002: 231); the definition was previously used on page 5.

 $^{^6}$ *Diner* and *sleeper* are defined as "railway carriages to dine/sleep <u>in</u>" (Huddleston and Pullum 2002: 1698).

a purpose in a person's value system" (Panther and Thornburg 2003: 295), and words like *keeper* 'an entity that is subjectively construed as worthy of being kept' and *holder* 'a stock that could pay off in the future and should therefore be held' would be examples of this subtype. True-patients are "the least productive" (ibid. 296) subtype and are "conceptualised as being in a resultant state after having undergone the action named in the base" (ibid.). Examples of this subtype would be *scrambler* 'scrambled egg dish' and *beater* 'beaten up (old) car'. The fourth subtype, patient events, are parallel in meaning to valued-patients, and the only difference is that valued-patients mainly refer to physical items (people or objects), whereas patient events refer to events (ibid. 302), e.g. *keeper* 'some thing worthy of being kept' and *forgetter* 'an immemorable event'. Although this role is listed as a separate semantic role in Huddleston and Pullum (2002), it is not mentioned in connection to *-er* suffixations. Adams does not mention it either, but Bauer does, marking it as a subtype of subject nominalizations (1983: 286).

The remaining meaning in Panther and Thornburg (2003) that is found with the suffixations in –er is that of an event with no specified semantic role (Panther and Thornburg 2003: 302), which is exemplified in words like *kegger* 'a beer drinking party' and *breather* 'short rest period during which one catches one's breath'. This is not one of the established semantic roles, and is therefore not mentioned in Huddleston and Pullum (2002), Adams (1973), or Bauer (1983). This seems to be one of the cases where the standard sets of semantic roles fail to capture the semantic essence of the nouns in question. While this may be seen as argument against using semantic roles in general, such cases seem to be in the minority.

It is also relevant to mention that -er is used "to form nouns denoting inhabitants of the place named in the base" (Huddleston and Pullum 2002: 1692), e.g. *Dubliner, Icelander*, but this is not one of the meanings that we shall be dealing with in the research of the corpus. Interestingly enough, this usage of the -er suffix is not mentioned in Panther and Thornburg (2003), Adams (1973), or Bauer (1983).

When it comes to the bases that the suffix -er can be attached to, it is important to note that it is most commonly attached to verbal bases (e.g. baker), but it can also be found with nominal bases (e.g. golfer), numerals (e.g. fiver), adverbs (e.g. oncer), adjectives (e.g. southerner), and phrases (e.g. dogooder)⁷.

_

⁷ The examples in this paragraph are all taken from (Huddleston and Pullum 2002).

From everything that was stated above, it can be concluded that *-er* has a wide range of meanings and can take many semantic roles, which makes it quite polysemous. Whether that is also the case with the matching Croatian suffix will be seen in the following chapter.

2.3. Semantic roles and bases connected with the suffix -ač

When it comes to the Croatian suffix $-a\check{c}$, the semantic roles that words formed with this suffix have are not as extensive as those of the English suffix -er. In fact, according to Babić, "[i]zvedenice sa sufiksom $-a\check{c}$ označuju čovjeka ..., životinju ..., oruđe ..., rjeđe neku drugu stvar" (1986: 73). That means that out of the previously defined semantic roles, the words ending in $-a\check{c}$ can take only the roles of the agent and the instrument. What is more, by looking at all the other typically agent-forming suffixes in Croatian; viz. -telj, etc., it becomes immediately obvious that none of them fares any better with respect to the scope of acceptable semantic roles (cf. Babić 1986: 63-336). Below, we present in more detail the semantic description of $-a\check{c}$ in Babić (1986), as well as Silić and Pranjković (2007).

The words in $-a\check{c}$ that take the role of the agent can be divided into two categories; the prototypical, "[p]rofessional human agent" (Panther and Thornburg 2003: 286) and what Panther and Thornburg term the agent-like animal (Silić and Pranjković 2007: 168). There are many examples for the professional human agent, and some of them are $\check{c}ista\check{c}$ (cleaner), $izvo\bar{d}a\check{c}$ (performer), $pjeva\check{c}$ (singer), $zabavlja\check{c}$ (entertainer), etc. The second category, the agent-like animal, is found in only one contemporary example for the name of an animal, $buka\check{c}$ (bittern), and there is also an example of a word that does not denote a specific animal, but rather a group of animals; $pre\check{z}iva\check{c}$ (ruminant) (ibid.).

As far as the semantic role of the instrument is concerned, it is usually subdivided into various groups according to the type of instrument that the word denotes. For instance, Babić names machine, device, vehicle, gadget, tool, muscle, thing in general, etc. as subtypes of the instrument (1986: 75). Since this distinction is rather subjective and there is a possibility of overlapping, these subtypes will be disregarded in the categorization of the examples that will be given later on. Some examples of words in $-a\check{c}$ that denote instruments are $oda\check{s}ilja\check{c}$ (transmitter), $odvija\check{c}$ (screwdriver), $upalja\check{c}$ (lighter), $otira\check{c}$ (doormat), etc.

⁸ "Derivatives with the suffix –ač denote a human being ..., an animal ..., a tool ..., more rarely another type of instrument" (Babić 1986, translated by author).

⁹ All examples given in this section are, except where otherwise noted, taken from (Babić 1986).

The same conclusion, viz. that the only two semantic roles connected with $-a\check{c}$ suffixations are the agent and the instrument, was reached in other Croatian linguistic works, as well (cf. Barić et al. 2005: 307, 317).

As for the type of bases that the suffix $-a\check{c}$ is most commonly attached to, Babić states that this suffix predominantly attaches to verbal bases (1986: 70), e.g. $pripovjeda\check{c}$ (storyteller/narrator), $prekida\check{c}$ (switch), etc. Of the other bases, there are only a few denominal nouns formed with this suffix; $roga\check{c}$ (carob), $truba\check{c}$ (trumpeter), $tenisa\check{c}$ (tennis player). There are also some compounds that end in this suffix, e.g. $minobaca\check{c}$ (minethrower), $nepu\check{s}a\check{c}$ (non-smoker); however, they were mostly formed by putting together two words or word parts, the second of which already contained the suffix $-a\check{c}$, so it cannot be claimed that the suffix $-a\check{c}$ attaches to complex bases (Babić 1986: 76).

It can be concluded from this overview of theoretical literature that the Croatian suffix $-a\check{c}$ has a much narrower set of meanings than the English suffix -er, which will also be proved by the analysis conducted on the corpora of English and Croatian.

3. Methodology

The analytical part of this paper was performed with the help of two corpora – the Corpus of Contemporary American English¹⁰ and Hrvatski nacionalni korpus¹¹. The former consists of 450 million words accumulated in the period between 1990 and 2012, and the latter consists of 216,8 million words.

Our English database was collected by using the automatic search option for the schematic string *er.[nn*] in the Corpus of Contemporary American English. The minimum frequency of the suffixations in the corpus was set to one, and the maximum number of the search results that the Corpus was able to deliver was 7,400. After examining the list of 7,400 most frequently used words in *-er*, we chose the most representative nouns. In other words, the words that end in *-er* but are not a result of suffixation, e.g. *water*, *mother*, and last names, e.g. *Springer*, were eliminated. Similarly, words that end in another suffix, such as *-ster*, or *-eer*, e.g. *youngster*, *engineer*, as well as words that do not belong to the word class of nouns, e.g. *other*, *better*, *alter* were also eliminated. Our final database includes 126 nouns. Afterwards, the appropriate contexts were selected for each noun from those selected, and the relevant semantic roles were identified based on the contextual information. The semantic roles that were used to describe the chosen words are those defined in Panther and Thornburg (2003) and presented in section 2.2. The word list that was thus formed can be seen in the following chapter.

As for the Croatian National Corpus, the data was gathered by accessing the website of the corpus and entering the formula ".*ač" in the search box, which produced 94,280 results of words in $-a\check{c}$. Since the search queries available for the Croatian National Corpus are not as sophisticated as those for the Corpus of Contemporary American English, i.e. multiple entries of the same noun types are given in a random list, it would have been difficult to arrive at the exact number of different noun types in $-a\check{c}$ without a time-consuming manual analysis. Hence, the multiple entries of the same word were observed if the word was deemed useful, and the most appropriate contextual information was chosen from those that were offered. As with the COCA, all the nouns ending in $-a\check{c}$ that were not formed by suffixation, e.g. $ma\check{c}$ (sword), $pla\check{c}$ (crying), as well as last names, e.g. $Kova\check{c}$, were disregarded. Our final database for the Croatian corpus consists of 130 words and can be found in chapter 4.2.

4. Analysis / findings

4.1. Analysis of the semantic roles of -er words in context

The selective list of *-er* suffixations from the Corpus of Contemporary American English is given in the table below. The words are listed according to their frequency of appearance in context, as shown in the Corpus¹². The words that are listed are shown in context, and the semantic role that they take based on the context is given in a separate column.

Table 1: Semantic roles of words formed with the suffix –er

| | WORD | CONTEXT | SEMANTIC ROLE |
|----|----------|---|---------------|
| 1. | teacher | The TEACHER may provide ideas such as a day trip to the | Agent |
| | | city or the local beach. | |
| 2. | player | I knew that a PLAYER with his capabilities could come back | Agent |
| | | into the match at any point | |
| | | Microsoft failed with the Zune, a music PLAYER that was | Instrument |
| | | designed to compete with the iPod. | |
| 3. | writer | In his books, and only in his books, a WRITER can do | Agent |
| | | anything he pleases, provided he has talent. | |
| 4. | driver | On the road, the DRIVER was reluctant to talk about our | Agent |
| | | destination. | |
| | | The operating system in the VM would call a device | Instrument |
| | | DRIVER to launch disk read or write requests. | |
| 5. | owner | The OWNER was in Mexico at the time and no one was hurt. | Experiencer |
| 6. | consumer | Criteria for Determining Treatment Outcomes for a Study | Agent |
| | | Scientific merit only tells the CONSUMER whether or not | |
| | | they should have confidence in the outcomes of a study | |
| 7. | reporter | An AP REPORTER recently found Lynn's birth certificate | Agent |
| | | online that listed a different birthdate | |
| 8. | reader | To uncover the textual evidence for such an interpretation, | Agent |
| | | the READER must shift attention from the male characters | |
| | | of the story | |
| | | with a simple hand-held code READER and a diagnostic | Instrument |

| 110. | tumač | podsjeća da je Tanhofer prvi izvanzagrebački TUMAČ | Agent |
| | | Krležinih dramskih tekstova. | |
| | | Plan je kopiran tako da bi uz njega trebao TUMAČ. | Instrument |
| 111. | udvarač | Željko Duvnjak kao Frankić, gazdin posilni i Tonkin | Agent |
| | | UDVARAČ | |
| 112. | ugovarač | glavni UGOVARAČ takvog posla je firma Adria Globe | Agent |
| | | Trade | |
| 113. | ulagač | da sam potencijalni ULAGAČ, možda ne bih te projekte | Agent |
| | | ocijenila tako izvrsnim | |
| 114. | upaljač | u trenutku kada je prinijela UPALJAČ zapalio se i plin koji | Instrument |
| | | se nakupio u ljetnoj kuhinjici. | |
| 115. | upravljač | vozači vozila ne smiju popiti ni kapi ako će za UPRAVLJAČ. | Instrument |
| 116. | uramljivač | Branimir Boras, danas poznati osječki URAMLJIVAČ slika | Agent |
| 117. | usisivač | prvi USISIVAČ izumljen je 1901. u Velikoj Britaniji | Instrument |
| 118. | usitnjivač | Udruzi su donirani silk i USITNJIVAČ s diskovima | Instrument |
| 119. | usmjerivač | Nepoznati počinitelj zastavu je vezao na USMJERIVAČ za | Instrument |
| | | letjelice | |
| 120. | utikač | Po završetku sušenja izvadite UTIKAČ iz priključnice. | Instrument |
| 121. | utovarivač | Radnici koji su se našli u blizini brzo su priskočili i uspjeli | Instrument |
| | | pomaknuti UTOVARIVAČ kako bi oslobodili kolegu ispod | |
| | | stroja | |
| 122. | uzgajivač | Hrvatska je, zajedno sa Slovenijom, danas najveći | Agent |
| | | UZGAJIVAČ lipicanaca. | |
| 123. | veslač | takav tretman prošao je istaknuti osječki VESLAČ Ivan | Agent |

| | | Jukić | |
|------|-------------|--|------------|
| 124. | vozač | Priveden je VOZAČ INA-e iz Zagreba | Agent |
| 125. | zabavljač | On je to odbio, ljutito kazavši kako je on visoki funkcionar HNS-a, a ne neki ZABAVLJAČ. | Agent |
| 126. | zagađivač | na terenu su inspekcijske službe koje će nakon uzimanja uzoraka utvrditi tko je ZAGAĐIVAČ | Agent |
| 127. | zamrzivač | U kuhinji je plinski štednjak s pećnicom, mikrovalna pećnica, veliki hladnjak, ZAMRZIVAČ, ledomat. | Instrument |
| 128. | zaslađivač | To je prirodni ZASLAĐIVAČ kojega ima u trešnjama i brezi. | Instrument |
| 129. | zatvarač | pomno je dizajniran i rukonaslon te patentni ZATVARAČ na presvlaci s mogućnosti skidanja. | Instrument |
| 130. | zlostavljač | Nije točno ni uvriježeno mišljenje da ZLOSTAVLJAČ koristi silu | Agent |

4.3. Discussion of the findings

Several things can be noticed when observing the word lists provided in the previous two sections. The first and most obvious one would be that the English suffix -er is much more polysemous than the Croatian suffix $-a\check{c}$. In 126 words that were taken into account, we can distinguish 181 meanings, and the semantic roles that are present in these meanings are the agent, agent-like animal, agent-like plant, agent-like inanimate object, agent/causer event, instrument, quasi-instrument, instrument-like event, experiencer, location, purpose-patient, valued-patient, true-patient, and event with no specified semantic role. Out of the 181 distinguished meanings, 61, or 33.7% belong to the semantic role of the agent. The second most frequent semantic role is that of the instrument, which is recognized in 56 meanings, or 30.94% of all meanings. The third most frequent semantic role is the agent/causer event, which is present in 18 meanings, or 9.94% of the meanings. Next, there is the role of the purpose-patient, which is found in 11 words and constitutes 6.08% of the entire list of meanings. The roles of the agent-like inanimate object, instrument-like event and location are each found six times in the list, which means that every one of them makes up 3.31% of the total. The role of the experiencer is found four times, constituting 2.21% of the total. The agent-like animal and the event with no specified semantic role are both found three times, and make up 1.66% each. Quasi-instruments, valued-patients and true-patients are found

twice each, which means that each of these semantic roles makes up 1.11%. Finally, the semantic role of the agent-like plant appears only once in the word list and makes up 0.55% of the total number of meanings. The only semantic role that is theoretically linked to the suffix -er, but was not attested in the corpus is that of a patient event, which is described in theory as quite rare.

As for the Croatian word list, the situation is less complex. In 130 chosen words, there are 141 attested meanings. 95, or 67.38% of these meanings take the semantic role of the agent, whereas the remaining 46, or 32.62% belong to the role of the instrument.

These facts show us that the English suffix -er is found in the formation of many different semantic roles with variations in productivity when it comes to each of them. It is most productive in the formation of agent and instrument nouns. This correlates to the use of the suffix $-a\check{c}$, which is also found to be productive in the formation of the agentive and the instrumental meanings; however, it is not found in the formation of other semantic roles. That makes it less polysemous than the suffix -er.

Another thing that can be noticed is the fact that the words that take the suffix -er are themselves more commonly found in more than one semantic role than those formed with the suffix $-a\check{c}$. For instance, out of 126 words that make up the English word list, 45 take two different semantic roles (they most commonly take the roles of some type of agent and some type of instrument, but can also be found in different agent-patient, agent-location, and instrument-patient combinations), and five take three different semantic roles (two of the five words take the semantic roles of agent, instrument and purpose-patient). This means that 39.68% of the total word number in the English list can be found in more than one semantic role. In Croatian, out of 130 words, only 11, or 8.46%, can have both semantic roles.

What is also noticeable is the fact that it is more difficult to analyze the semantic roles of the words in -er, since there is often conceptual closeness between the semantic roles that the same word can take; e.g. words like *locker* and *drawer* can be analyzed as both instrument and location, as explained in footnote 12. For reasons stated in the aforementioned footnote, the semantic role we opted for in the case of these words is the instrument, and not the location; however, that does not take away from the polysemy of the English suffix -er, since, even with this instrument-over-location interpretation, the suffix -er is still much more polysemous than the suffix $-a\check{c}$.

The difference in the variety of semantic roles that these two suffixes can be used to produce is a result of the difference in the system of suffixes that exists in Croatian and English. For instance, the suffix $-a\check{c}$ is only used to produce words that can take the semantic

roles of agent and instrument because there are other existing suffixes that are more productive in the formation of words that denote locations or patients; such suffixes would, for example, be $-a\check{c}nica$, -ana, $-i\check{s}te$, etc. for location (Silić and Pranjković 2007: 167) and -anik, -enik, -nik, etc. for patient (ibid. 166). As for the suffix -er, it is probably used to form a greater variety of semantic roles due to the fact that English has fewer suffixes that are productively used in the formation of locative, patient, etc. nouns. For instance, there are few specifically locative suffixes in English, (Adams and Bauer do not mention any suffixes connected specifically to the locative meaning), and the one suffix that is more or less reserved for the patient role in English is -ee (cf. Bauer 1983: 243-53). This 'competing suffixes' idea seems to be a major, if not the decisive explanatory factor for the observed differences between English -er and Croatian $-a\check{c}$. However, a full exploration of the merits of this proposal must be postponed until a much more thorough and extensive contrastive corpus analysis.

Another interesting observation is that some of the less typical semantic roles in the English database, especially agent/causer events and various types of patients, are more commonly found with complex, phrasal bases. At the same time, Croatian nouns in $-a\check{c}$ do not appear to take phrasal bases, and also do not take agent/causer event and patient roles. Of course, it is hard to find a causal link between these two factors, viz. not taking phrasal bases and not exploiting the mentioned semantic roles, since there simply appears to be no principled reason why agent/causer event or patient meanings would not be expressible with simple bases. However, there does appear to be some correlation between the two factors, and the relevance of this correlation might be explored in more detail in a future study.

5. Conclusion

The goal of this paper was to compare the English suffix -er and the Croatian suffix $-a\check{c}$ in regard to their productivity in the word formation of their respective languages. By giving a brief overview of the theoretical approach to these two suffixes, and by conducting research in the corpora of English and Croatian based on this theoretical overview, it was discovered that these two suffixes correspond in the formation of words that take the semantic roles of agent and instrument. These are the only two semantic roles that the suffix $-a\check{c}$ is associated with, whereas the suffix -er is used in the formation of words with a greater variety of semantic roles, with varying degrees of productivity when it comes to each of these roles. Like the Croatian suffix, it was found to be the most productive in the formation of agent and instrument nouns, and less productive when it comes to the formation of words with other semantic roles. The difference in the usage of the suffixes was attributed to the difference in the systems of suffixes used in the word formation of the two languages, as well as to the difference in the types of bases that each of these suffixes attaches to. From everything that was discovered throughout this research, it can be concluded that the suffix -er is much more polysemous and has a much wider usage than the suffix $-a\check{c}$.
